In a move to further improve multilingual access to information contained in patent documents, the European Patent Office (EPO) made available a second set of European languages in its free automatic translation service Patent Translate. With the addition of Danish, Dutch, Finnish, Greek, Hungarian, Norwegian and Polish, the service now enables on-the-fly-translation from, and into, English for thirteen languages and is accessible on the EPO's free online patent database, Espacenet.

"Patent Translate facilitates access to state-of-the-art technologies for European inventors and businesses by removing the language barrier from patent documentation," said [unclear] countries better access to patent documents. English to a very large number of users. competitiveness of European enterprises.

Patent Translate was launched this February on the EPO's website. Starting with a first set of languages Spanish and Swedish, by the end of the year, the important non-European languages will be added.

The service aims to help European businesses access patent information into the EPO's free patent database, Espacenet. The service is also expected to facilitate the implementation of the future unitary patent, which includes an important chapter on translation. With the unitary patent reducing the burden on companies to provide mandatory translations, automatic translation will be even more important as a means of offering free access to patent documents in any official language. The development of this tool underlines the EPO's role as a leading global provider of patent information.

In a move to further improve multilingual search, the EPO has made available a second set of European language patent documents in Finnish, Greek, Hungarian, Norwegian and Swedish. This set of languages is accessible on the EPO's Espacenet website.

"Patent Translate facilitates access to state-of-the-art patent documentation, said to be a major barrier from patent documentation," said the EPO. The service gives countries better access to patent documents. It is available in English to a very large number of countries. This will improve the competitiveness of European businesses.

Patent Translate was launched this February. It is currently available in English, French, German, Italian, Portuguese, Spanish and Swedish, by the end of 2014 the service is expected to cover all 28 languages of the EPO's 38 member states, plus the most important non-European languages in patents, including Chinese, Japanese, Korean and Russian.

The service aims to help European businesses better search and identify relevant patent documents for their R&D projects. It is integrated into the EPO's free patent database, Espacenet, which includes more than 75 million entries from around the world. Patent Translate is also expected to facilitate the implementation of the future unitary patent, which includes an important chapter on translation. With the unitary patent reducing the burden on companies to provide mandatory translations, automatic translation will be even more important as a means of offering free access to patent documents in any official language. The development of this tool underlines the EPO's role as a leading global provider of patent information.

Introduction to espacenet®

Here are some basic things you need to know before using *espacenet®*

About patents

Patents are legal titles protecting inventions. They offer a temporary private right to the holder of the invention who can prevent others from using his patented invention.

Such an exclusive position is often necessary to recoup the R&D investments that were necessary to develop the invention. The patent system therefore promotes innovation by financially rewarding inventors.

About Patent databases

As any exclusive ownership rights, patents must be accessible to the public if the owner wants to exert his right. Today, patents are usually published and accessible through electronic means.

As any exclusive ownership rights, patents must be accessible to the public if the owner wants to exert his right. Today, patents are usually published and accessible through electronic means.

In several technical fields, Patents are the most efficient source of information for the following reasons.

- **Accessibility:** All patent documents have a universal format for the bibliographic data. More than 50 different fields, each representing valuable technical or strategic information, are accessible for each Patent. In addition to this, Patents are classified according to internationally agreed systems, which divides technical domains into more than 100,000 subdivisions.
- **Content:** A patent, to be valid, should enable a person skilled in that particular area to reproduce the invention. This strict requirement explains why 70% of the information contained in Patents is not available elsewhere. When a catalogue or an article describes a product in a few lines, the corresponding Patent often consists of 20 pages. Patents represent about 350 million of A4 pages containing very relevant technical information.
- **Concentration:** Full patent collections are often present in national Patent Office archives. From a relevant list of patent documents you will need one or two hours in a patent library to collect all the data. In comparison, you will usually need several weeks to order and receive the references quoted in a thesis.
- **Up to date:** A company is not inclined to make its inventions public. To get a legal protection for the invention, the company generally files

As any exclusive ownership rights, patents must be accessible to the public if the owner wants to exert his right. Today, patents are usually published and accessible through electronic means.

In several technical fields, Patents are the most efficient source of information for the following reasons.

- **Accessibility:** All patent documents have a universal format for the bibliographic data. More than 50 different fields, each representing valuable technical or strategic information, are accessible for each Patent. In addition to this, Patents are classified according to internationally agreed systems, which divides technical domains into more than 100,000 subdivisions.
- **Content:** A patent, to be valid, should enable a person skilled in that particular area to reproduce the invention. This strict requirement explains why 70% of the information contained in Patents is not available elsewhere. When a catalogue or an article describes a product in a few lines, the corresponding Patent often consists of 20 pages. Patents represent about 350 million of A4 pages containing very relevant technical information.
- **Concentration:** Full patent collections are often present in national Patent Office archives. From a relevant list of patent documents you will need one or two hours in a patent library to collect all the data. In comparison, you will usually need several weeks to order and receive the references quoted in a thesis.
- **Up to date:** A company is not inclined to make its inventions public. To get a legal protection for the invention, the company generally files the Patent Application at the earliest possible stage. Patent Applications are normally published 18 months after their first filing date and therefore very often represent the first published information available. In other words newly published Patents are the most up-to-date information available in a specific field.

About Coverage and Content

Do not expect to cover the whole state-of-the-art by searching in national Patents only.

Databases available on *espa@cenet*® have also some limitations in the number and the quality of fields accessible that should be considered when drawing conclusions from the result of a search.

Commercial patent databases usually offer extra value, by the number of fields you can access, and due to the content of the abstract that has been rewritten to facilitate easier access to the document by keyword searches.

To sum up, a patent database user should always be aware of the content of the database he is using and know the limitations of the fields.

About Classification

Patents are classified according to various classification schemes covering all possible technical domains. When conducting a search, it is essential to systematically use this tool that offers an objective criteria to access relevant documents. Keywords are much more subjective as there are many words to describe a same concept.

Seven points to consider before starting your search

Here are some basic things you need to know before you start searching.

1. The concept approach

Usually, a prior art search boils down to a combination of concepts defining the subject you are looking for.

A patent prior art search consists in finding relevant documents in a collection of patent documents. The fields searched are usually abstracts or classification symbols.

In a patent record, the content of the invention is described in the abstract and the classification symbols attributed to the patent have been chosen among the thousands available in the classification scheme and are usually indexes best characterising the technical content of the patent document.

In the abstract, you will find words, adjectives and verbs that linked together form sentences expressing your searched subject. If the expression of the subject remains the same in all relevant documents, words, verbs and adjectives vary from one relevant document to another.

The expression of the technical subject is a combination of concepts that will remain common to all relevant documents.

Knowing that the documents you are looking for have these common features ? these so called concepts ? your search will consist in finding documents where a given combination of concepts is present.

Since patent documents are classified, searching for a given concept should not be limited to a keyword search. A concept can perfectly be represented by a classification symbol.

A sound search strategy will therefore involve combination of keywords and classification symbols. An individual concept is usually defined by an "or" combination of keywords and classification symbols all relating to this concept.

The experience shows that it is not easy from the start to define all possible synonyms and classifications covering one concept. This usually remains an imperfect process. It can be tuned during the search itself: relevant documents reveal new ways to express your concepts. Using these new concepts more documents can be retrieved and so on. This becomes an iterative process that an experienced searcher brings to an end when he has the feeling that additional efforts will not bring more results.

usually remains an imperfect process. It can be halted during the search itself. Relevant documents reveal new ways to express your concepts. Using these new concepts more documents can be retrieved and so on. This becomes an iterative process that an experienced searcher brings to an end when he has the feeling that additional efforts will not bring more results.

2. The more, the easiest

The easiness of a prior art search is proportional to the number of documents relevant to your subject that are contained in the searched collection.

If there are hundreds of documents relating to your searched subject in the databases the chances were very high that even using a clumsy combination of keywords you would find a relevant document. It is quite simple to understand why. Hundreds of relevant documents mean that there are almost hundred different abstracts in the database that describe more or less the same invention. Chances are therefore very high that all possible keywords one would think of are used in some of these abstracts. In other words, if you ask 100 people to describe this invention in a few sentences, you are sure to be able to retrieve at least one of these descriptions using your own combination of keywords.

Consequently, one can say that a search is difficult when the number of documents in the database corresponding to your subject is low. This is usually the case in real life: none or very few relevant documents relating to your subject exist. In such a case the iterative concept approach exposed previously is extremely powerful and should yield these few documents.

3. Think lateral

To get out of a search dead end try to think lateral to find new concepts defining your subject.

To retrieve additional concepts possibly covering the invention, you sometimes have to think lateral: exploring multiple possibilities and approaches instead of pursuing a single approach.

4. The limits of the concept approach

When a subject cannot be expressed in a "normal" sentence, the concept approach is not applicable or can only be applicable in presence of good indexing schemes.

It would be wrong to present the concept approach as "the" universal search strategy.

5. I found nothing

Absence of evidence is no evidence of absence

Even experienced searchers cope with cases where no relevant results have been obtained. This does not mean that no relevant document exists or can be found. The above maxim is well known among archaeologists: if you do not find remains of an old temple, it does not mean that the temple did not exist or cannot be found elsewhere.

In patent searches such phenomena happen quite often and for various reasons:

- A searcher may not have used the winning combination; a common case among novice searchers.
- Some fields you are using like the classification are absent from certain patent records. This can be the case in databases covering collections that have not been classified for instance.

To get out of a search dead end try to think lateral to find new concepts defining your subject.

To retrieve additional concepts possibly covering the invention, you sometimes have to think lateral: exploring multiple possibilities and approaches instead of pursuing a single approach.

4. The limits of the concept approach

When a subject cannot be expressed in a "normal" sentence, the concept approach is not applicable or can only be applicable in presence of good indexing schemes.

It would be wrong to present the concept approach as "the" universal search strategy.

5. I found nothing

Absence of evidence is no evidence of absence

Even experienced searchers cope with cases where no relevant results have been obtained. This does not mean that no relevant document exists or can be found. The above maxim is well known among archaeologists: if you do not find remains of an old temple, it does not mean that the temple did not exist or cannot be found elsewhere.

In patent searches such phenomena happen quite often and for various reasons:

- A searcher may not have used the winning combination; a common case among novice searchers.
- Some fields you are using like the classification are absent from certain patent records. This can be the case in databases covering collections that have not been classified for instance.

6. Use the Web to its full extent

Specific patent searches are sometimes best conducted using both the information available on the Web and in patent databases.

One often overlooks combined information that can be obtained from the World Wide Web and from patent sources. Patents or inventors are often mentioned in texts found on the Internet giving precious indications to be able to continue the search in patent databases.

7. Use the right tools

Using free patent search tools is not necessarily more cost effective than using fee based databases.

This last principle belongs to common sense. But many discussions with patent professionals often reveal that free tools are sometimes too blindly trusted. This is due to the incorrect impression that free services offer as much information if not more than commercial databases. Users need to be clearly informed on the limitations of free products. For instance, abstracts in *espacenet*, are not always available when they are present in some well-known commercial databases. In addition, even if you push free systems to their limits being aware of their strengths and of their weaknesses you will often spend much more time finding results than by using fee based tools. The costs of a patent professional spending 2 hours on a free system are often higher than the costs - working and database costs added together - of such a professional spending 15 minutes on a fee based system.

In a move to further improve multilingual access to information contained available a second set of European languages in its free automatic trans... Finnish, Greek, Hungarian, Norwegian and Polish, the service now enable... languages and is accessible on the EPO's free online patent database, E...

"Patent Translate facilitates access to state-of-the-art technologies for Eur... barrier from patent documentation," said EPO President Benoît Battistelli. We are very pleased to offer to users in this new group of... countries better access to patent documents from all over the world, while making information about their inventions readily available in... English to a very large number of users. This is an important step forward in ensuring patent quality, and contributes to strengthening the... competitiveness of European enterprises," he said.

Patent Translate was launched this February to enable multilingual access to the vast collection of patent documents available on the EPO website. Starting with a first set of languages allowing automatic translation from and into English for French, German, Italian, Portuguese, Spanish and Swedish, by the end of 2014 the service is expected to cover all 28 languages of the EPO's 38 member states, plus the most important non-European languages in patents, including Chinese, Japanese, Korean and Russian.

The service aims to help European businesses better search and identify relevant patent documents for their R&D projects. It is integrated into the EPO's free patent database, Espacenet, which includes more than 75 million entries from around the world. Patent Translate is also expected to facilitate the implementation of the future unitary patent, which includes an important chapter on translation. With the unitary patent reducing the burden on companies to provide mandatory translations, automatic translation will be even more important as a means of offering free access to patent documents in any official language. The development of this tool underlines the EPO's role as a leading global provider of patent information.

In a move to further improve multilingual access to information, Espacenet will now also offer to its users available a second set of European languages in its free automatic translation service. In addition to English, Finnish, Greek, Hungarian, Norwegian and Polish, the service now also covers Chinese, Japanese, Korean and Russian and is accessible on the EPO's free online patent database, Espacenet.

"Patent Translate facilitates access to state-of-the-art technological information for researchers and inventors from patent documentation," said EPO President Benoît Battistelli. "We are very pleased to offer to users in this new group of countries better access to patent documents from all over the world, while making information about their inventions readily available in English to a very large number of users. This is an important step forward in ensuring patent quality, and contributes to strengthening the competitiveness of European enterprises," he said.

Exemplo: EP0936959

Patent Translate was launched this February to enable multilingual access to the vast collection of patent documents available on the EPO website. Starting with a first set of languages allowing automatic translation from and into English for French, German, Italian, Portuguese, Spanish and Swedish, by the end of 2014 the service is expected to cover all 28 languages of the EPO's 38 member states, plus the most important non-European languages in patents, including Chinese, Japanese, Korean and Russian.

The service aims to help European businesses better search and identify relevant patent documents for their R&D projects. It is integrated into the EPO's free patent database, Espacenet, which includes more than 75 million entries from around the world. Patent Translate is also expected to facilitate the implementation of the future unitary patent, which includes an important chapter on translation. With the unitary patent reducing the burden on companies to provide mandatory translations, automatic translation will be even more important as a means of offering free access to patent documents in any official language. The development of this tool underlines the EPO's role as a leading global provider of patent information.
